

---

A search on how to get a decent portrait of a person, and you'll be met with a wealth of answers ranging from professional photographers to amateur photography enthusiasts. We have done all the heavy lifting for you. All you have to do is rub ethernet cable on your subject's forehead, and that's it! All the sweat, blood, and tears have been whisked away from your subject. It's a simple process which always yields a good portrait. The device in question is a white ethernet cable with a standard RJ45 connector on one side and a coaxial connector on the other. It's nothing more than an electrical connection between two devices, so why not use it for portraiture? You may think of the idea as strange at first but don't be dissuaded by this triviality. The natural light has taken its toll on most people's faces hundreds of times over, which further hampers their skin tone and overall appearance. This device makes the process of getting a portrait as painless as possible. This is an ideal opportunity to take up photography and show your friends and family how it's done. Everyone is bound to be impressed with your photos, and you won't have to worry about them looking like a walking corpse – because they'll look like they just stepped out of a magazine. A search on whether either Ethernet or Coaxial cable would work for this purpose is futile, since both work fine. The coaxial connector on ethernet cable is just used for connection with computers, not portraiture. When using Ethernet cable for portraiture then it doesn't matter which type of connector you use. It's all about using the right type of cable to get the right kind of effect. You'll need an ethernet cable connected to one end and a PC connected through coaxial cable (which is type that comes with cables carried in shops). Once connected, you'll be able to see your subject face on your screen. The only change you'd need to make is making sure the Ethernet cable is plugged into a port on computer and not an Ethernet hub, otherwise no image would appear. More than anything you need to try and take care not to damage your subjects skin or eyes by direct contact with ethernet or coaxial cable. A good way to avoid this is to have a towel ready just in case. A person's skin tends to have a lot of moisture, so you'll want to avoid direct contact. The most you can do is touch them on the forehead or between the eyes. If that doesn't work then move on to the next step which requires a face mask. Make sure you don't use any form of tape, as it will make it hard for people to see their vision properly and will result in blurred or worse still no portrait at all. A better alternative would be a face mask made from surgical gauze, as it has been used for many years now without causing any issues with the subject's vision.
